

Hill Claiming Search Comparisons

Variant	Neighbor Evaluation Strategy	Best Used For
Simple Hill Climbing	Evaluates predefined neighbors sequentially, moves to the first better one.	Small, ordered neighbor spaces.
Stochastic	Evaluates neighbors and chooses randomly among all better moves.	Landscapes requiring probabilistic exploration.
Steepest-Ascent	Evaluates all neighbors, moves to the absolute best one.	Small spaces where optimal local steps matter.
First-Choice	Generates neighbors randomly, moves to the first better one.	Infinite or massive neighbor spaces.
